### Storage Solutions

- DAS (Direct Attached Storage)
- NAS (Network Attached Storage)
- SAN (Storage Area Network)

The simplest way of understanding a storage area network is to compare it to an already popular type of IT infrastructure solution—the local area network (LAN), which enables multiple PCs to share key IT resources such as applications, servers, shared files and printers. SANs provide similar resource sharing, but are specifically designed for servers to share storage devices such as disk arrays or tape libraries. The majority of SANs deployed today are built on the fibre-channel (FC) protocol, which offers high levels of performance and availability for demanding users. However, there are now also IP SAN solutions based on the iSCSI protocol, which enable smaller IT environments to benefit from shared network storage at a particularly favorable price.

### Network Solutions

The conventional computer networks are now superseded by integrated networks which combine sound and image. In order to establish integrated communication solutions, it is necessary to perform a very diligent study starting from the cabling infrastructure.
